Java Syntax

In the previous chapter, we created a Java file called `Main.java`, and we used the following code to print "Hello World" to the screen:

Example

[Get your own Java Server](#)

Main.java

```
public class Main {  
    public static void main(String[] args) {  
        System.out.println("Hello World");  
    }  
}
```

[Try it Yourself »](#)

Example explained

Every line of code that runs in Java must be inside a `class`. The class name should always start with an uppercase first letter. In our example, we named the class **Main**.

Note: Java is case-sensitive. `MyClass` and `myclass` would be treated as two completely different names.

The name of the Java file **must match** the class name. So if your class is called `Main`, the file must be saved as `Main.java`. This is because Java uses the class name to find and run your code. If the names don't match, Java will give an error and the program will not run.

```
Hello World
```

The main Method

The `main()` method is required in every Java program. It is where the program starts running:

```
public static void main(String[] args)
```

Any code placed inside the `main()` method will be executed.

For now, you don't need to understand the keywords `public`, `static`, and `void`. You will learn about them later in this tutorial. Just remember: `main()` is the starting point of every Java program.

[REMOVE ADS](#)

System.out.println()

Inside the `main()` method, we can use the `println()` method to print a line of text to the screen:

Example

```
public static void main(String[] args) {  
    System.out.println("Hello World");  
}
```

Note: The curly braces `{ }` mark the beginning and the end of a block of code.

`System.out.println()` may look long, but you can think of it as a single command that means: **"Send this text to the screen."**

Here's what each part means (you will learn the details later):

- `System` is a built-in Java class.
- `out` is a member of `System`, short for "output".
- `println()` is a method, short for "print line".

Finally, remember that each Java statement must end with a semicolon (`;`).

Exercise [?]

Drag and drop the correct class name to match the file name `Main.java` .

```
public class    Main    {  
    public static void main(String[] args) {  
        System.out.println("Hello");  
    }  
}
```

main

class

JavaClass
